Errors	Amount
15 issues with duplicate title tags	15
About this issue:	0
Our crawler reports pages that have duplicate title tags only if they are exact matches. Duplicate <title> tags make it difficult for search engines to determine which of a website's pages is relevant for a specific search query, and which one should be prioritized in search results. Pages with duplicate titles have a lower chance of ranking well and are at risk of being banned. Moreover, identical <title> tags confuse users as to which webpage they should follow. How to fix: Provide a unique and concise title for each of your pages that contains your most important keywords. For information on how to create effective titles, please see this Google article. You can also view the On-Page SEO Basics: Meta Descriptions article	
1 page returned a 4XX status code	1
About this issue:	0
A 4xx error means that a webpage cannot be accessed. This is usually the result of broken links. These errors prevent users and search engine robots from accessing your webpages, and can negatively affect both user experience and search engine crawlability. This will in turn lead to a drop in traffic driven to your website. Please be aware that crawler may detect a working link as broken if your website blocks our crawler from accessing it. This usually happens due to the following reasons: - DDoS protection system - Overloaded or misconfigured server How to fix: If a webpage returns an error, remove all links leading to the error page or replace it with another resource. To identify all pages on your website that contain links to a 4xx page, click "View broken links" next to the error page. If the links reported as 4xx do work when accessed with a browser, you can try either of the following: - Contact your web hosting support team - Instruct search engine robots not to crawl your website too frequently by specifying the "crawl-delay" directive in your robots.txt

1 page couldn't be crawled (DNS resolution issue)	1
About this issue:	0
A DNS resolution error is reported when our crawler can't resolve the hostname when trying to access your webpage.	
How to fix:	
Please contact your web hosting technical support and ask them to investigate and fix the issue.

255 issues with unminified JavaScript and CSS files	255
--	-----

About this issue:

Minification is the process of removing unnecessary lines, white space and comments from the source code.

Minifying JavaScript and CSS files makes their size smaller, thereby decreasing your page load time, providing a better user experience and improving your search engine rankings.

For more information, please see [this Google article](#).

How to fix:

Minify your JavaScript and CSS files.

If your webpage uses CSS and JS files that are hosted on an external site, contact the website owner and ask them to minify their files.

If this issue doesn't affect your page load time, simply ignore it.

15 pages don't have meta descriptions	15
--	----

About this issue:

Though meta descriptions don't have a direct influence on rankings, they are used by search engines to display your page's description in search results. A good description helps users know what your page is about and encourages them to click on it. If your page's meta description tag is missing, search engines will usually display its first sentence, which may be irrelevant and unappealing to users.

For more information, please see these articles: [Create good titles and snippets in Search Results](#) and [On-Page SEO Basics: Meta Descriptions](#)

How to fix:

In order to gain a higher click-through rate, you should ensure that all of your webpages have meta descriptions that contain relevant keywords.

Warnings	Amount
15 pages have no hreflang and lang attributes About this issue: This issue is reported if your page has neither lang nor hreflang attribute. When running a multilingual website, you should make sure that you're doing it correctly. First, you should use a hreflang attribute to indicate to Google which pages should be shown to visitors based on their location. That way, you can rest assured that your users will always land on the correct language version of your website. You should also declare a language for your webpage's content (i.e., lang attribute). Otherwise, your web text might not be recognized by search engines. It also may not appear in search results, or may be displayed incorrectly. How to fix: Perform the following: - Add a lang attribute to the <html> tag, e.g., "<html lang='en'>" - Add a hreflang attribute to your page's <head> tag, e.g., <link rel='alternate' href='http://example.com/' hreflang='en'/>	15 0
7 pages have a low word count About this issue: This issue is triggered if the number of words on your webpage is less than 200. The amount of text placed on your webpage is a quality signal to search engines. Search engines prefer to provide as much information to users as possible, so pages with longer content tend to be placed higher in search results, as opposed to those with lower word counts. For more information, please view this video How to fix: Improve your on-page content and be sure to include more than 200 meaningful words.	7 0
6 pages have low text-HTML ratio About this issue: Your text to HTML ratio indicates the amount of actual text you have on your webpage compared to the amount of code. This issue is triggered when your text to HTML is 10% or less. Search engines have begun focusing on pages that contain more content. That's why a higher text to HTML ratio means your page has a better chance of getting a good position in search results. Less code increases your page's load speed and also helps your rankings. It also helps search engine robots crawl your website faster. How to fix: Split your webpage's text content and code into separate files and compare their size. If the size of your code file exceeds the size of the text file, review your page's HTML code and consider optimizing its structure and removing embedded scripts and styles.	6 0

Warnings	Amount
3 pages don't have an h1 heading About this issue: While less important than <title> tags, h1 headings still help define your page's topic for search engines and users. If an <h1> tag is empty or missing, search engines may place your page lower than they would otherwise. Besides, a lack of an <h1> tag breaks your page's heading hierarchy, which is not SEO friendly. How to fix: Provide a concise, relevant h1 heading for each of your page.	3 0
2 pages have underscores in the URL About this issue: When it comes to URL structure, using underscores as word separators is not recommended because search engines may not interpret them correctly and may consider them to be a part of a word. Using hyphens instead of underscores makes it easier for search engines to understand what your page is about. Although using underscores doesn't have a huge impact on webpage visibility, it decreases your page's chances of appearing in search results, as opposed to when hyphens are used. For more information, please see this Google article How to fix: Replace underscores with hyphens. However, if your page ranks well, we do not recommend that you do this.	2 0
1 page has duplicate H1 and title tags About this issue: It is a bad idea to duplicate your title tag content in your first-level header. If your page's <title> and <h1> tags match, the latter may appear over-optimized to search engines. Also, using the same content in titles and headers means a lost opportunity to incorporate other relevant keywords for your page. For more information, please see this Google article How to fix: Try to create different content for your <title> and <h1> tags.	1 0
1 URL with a temporary redirect About this issue: Temporary redirects (i.e., a 302 and a 307 redirect) mean that a page has been temporarily moved to a new location. Search engines will continue to index the redirected page, and no link juice or traffic is passed to the new page, which is why temporary redirects can damage your search rankings if used by mistake. How to fix: Review all URLs to make sure the use of 302 and 307 redirects is justified. If so, don't forget to remove them when they are no longer needed. However, if you permanently move any page, replace a 302/307 redirect with a 301/308 one.	1 0

Warnings	Amount
Sitemap.xml not indicated in robots.txt About this issue: If you have both a sitemap.xml and a robots.txt file on your website, it is a good practice to place a link to your sitemap.xml in your robots.txt, which will allow search engines to better understand what content they should crawl. How to fix: Specify the location of your sitemap.xml in your robots.txt. To check if Googlebot can index your sitemap.xml file, use the Sitemaps report in Google Search Console	1 0
Sitemap.xml not found About this issue: A sitemap.xml file is used to list all URLs available for crawling. It can also include additional data about each URL. Using a sitemap.xml file is quite beneficial. Not only does it provide easier navigation and better visibility to search engines, it also quickly informs search engines about any new or updated content on your website. Therefore, your website will be crawled faster and more intelligently. How to fix: Consider generating a sitemap.xml file if you don't already have one. Then you should specify the location of your sitemap.xml files in your robots.txt, and check if Googlebot can index your sitemap.xml file with the Sitemaps report in Google Search Console	1 0

7 pages have only one incoming internal link

7

About this issue:

0

Having few incoming internal links means little to no visits or chances of being placed in search results.

How to fix:

Add more incoming internal links to pages with important content.

6 pages have more than one H1 tag

6

About this issue:

0

Although multiple <h1> tags are allowed in HTML5, we still do not recommend that you use more than one <h1> tag per page. Including multiple <h1> tags may confuse users.

How to fix:

Use multiple <h2>-<h6> tags instead of an <h1>.

lms.txt not found

1

About this issue:

0

The `lms.txt` file helps AI search engines better understand your website's content by providing LLM-friendly information. This file offers a short summary, guidance, and links to other useful resources.

How to fix:

- Create an `lms.txt` file.
- Place it in your website's root directory and ensure the file is accessible.
- Refer to lms.txt.org for examples and tips on how to properly create and manage it.

1 link on this page have no anchor text

1

About this issue:

0

The issue is triggered if a link (external or internal) on your site has an empty or naked anchor (i.e., just a URL), or anchor text only contains special characters. This issue makes it difficult for the crawlers to understand what the page is about and affects the performance of the linked-to page in search results.

How to fix:

Use anchor text for your links where it is necessary. The link text must give users and search engines at least a basic idea of what the target page is about. Also, use short but descriptive text. [Learn more](#)
